SAFETY - SUPPORT
AT YOUR FINGERTIPS

Emergency help, quickly accessible

One-touch SOS

A press-and-hold SOS action starts the emergency response flow.

The protection screen shows whether safety protection is active.

Trusted contacts

Add and manage emergency contacts for alerts.

SOS can share incident details and location with configured contacts.

Calls and helplines

Quick access to police calling and womens helpline information.

Numbers and availability depend on region and device.

Live location and alert delivery

Incident location can be shared with contacts and, where enabled, nearby opted-in helpers.

Push, SMS, WhatsApp and network delivery depend on permissions, connectivity and service configuration.

Multiple ways to activate protection

Optional hands-free and discreet triggers can be configured in the app.

Voice phrase

Offline voice trigger phrase can start SOS.

Volume keys

A configured key sequence can trigger SOS when enabled.

Scream detection

On-device audio classification can recognize distress sounds.

Fall detection

Motion sensor patterns can trigger an SOS flow.

Headset / BLE button

Supported headset actions or paired BLE button can act as a trigger.

Device guard

SIM or shutdown signals can invoke configured safeguards.

Triggers require setup and Android permissions; sensor-based detection may be imperfect.

Safer journeys and location sharing

Timed safety check-ins

Set a check-in deadline and optional note.

Overdue check-ins can escalate into an incident and notify configured contacts.

Journey tools

Cab and meeting safety modes, trip details and safety settings support planning while travelling.

A live journey entry can appear on the home screen.

Safe places and geofences

Manage saved safe zones and geofence settings.

Permissions and background access affect operation.

Live sharing and safety map

Share live location with a circle and view community safety information on a map.

Sharing is controlled by the user and location access.

Capture, organize and document

Emergency evidence capture

Emergency flows can collect photos, audio and video where supported.

Uploads can be associated with an incident.

Evidence vault and export

Review stored emergency media and incident records.

Tools include export and report or complaint templates.

Private incident diary

Record incident details in a diary and keep a personal timeline.

Cloud delivery

Uploads use the companion API when configured; retry workers help handle connectivity interruptions.

Support from trusted people and community

Trusted Circle

Link guardians or trusted people.
Share location when the user enables sharing.

Nearby helpers

Opt-in volunteers can receive nearby SOS alerts and respond through the app.

Community and map

Community posts, discussion threads and safety map features connect local users.

Controls built into the experience

Helper participation is opt-in. Community content and helper activity depend on active users and network access.
Alerts and location visibility depend on the selected settings and backend services.

Everyday wellbeing and practical safety

Cycle tracking

Log cycle information and view estimates in the daily section.

Quizzes and learning

Daily quiz and safety education content encourage practical awareness.

Commute tools

Commute planning and daily prompts bring safety habits into routines.

Discreet support

A fake call feature can provide a planned interruption or exit aid.

Personal settings

Profile, appearance, PIN, trigger setup, emergency contacts and safety preferences are managed in the app.
